

Draped Peer Feedback

I really enjoyed your presentation and thought Draped is a compelling idea. As someone who is Indian but doesn't wear South Asian clothing regularly, I've personally faced this exact problem; it's hard to justify spending a lot on garments that are worn infrequently. I also thought your prototype was strong; the UI felt very intuitive and easy to navigate, which is critical for a marketplace product.

Two questions I had during your presentation, that could be useful to consider:

- Liquidity risk early on - how do you ensure enough inventory across sizes, styles, and geographies?
- Last-minute use cases (events) - are timelines/logistics fast enough to support this?

Two areas where I see opportunities for improvement:

1. Prioritization of AI/AR features

AI-powered fit technology and pricing guidance are positioned in your later phases. Given that these are core differentiators vs. existing platforms like Poshmark, I would consider pulling at least a lightweight version of these features into the initial launch. Fit uncertainty is one of the biggest friction points in apparel rental, and solving this early could help overcome cold start challenges by driving user trust and platform switching.

Event-based discovery is strong - could you go further with "complete look" recommendations (outfit + accessories)? Using AI for styling guidance could be a key wedge here, especially for users less familiar with cultural norms. These could be tied to South Asian accessories being rented on the platform, for example.

2. Garment care and trust mechanisms

A key risk I see in this category is the delicate nature of South Asian garments. Concerns around damage, improper care, or loss could significantly impact the experience of both listers and borrowers. I would suggest building trust features early, such as:

- Clear garment condition standards and verification
- Security deposits or insurance options
- Ratings/reviews tied specifically to garment care
- Integrated cleaning/logistics partnerships

Overall, I think this is a strong concept with clear demand, and your phased approach makes sense. Tightening the prioritization around trust and fit - the core blockers to adoption - could make the MVP even stronger.
