

General Project Feedback for Draped:

- **Were the right features selected as must-haves for initial launch correct? What additional features might be critical or which selected features might not be Critical?**

I think the right features were selected as must haves for the launch and platform as it's important to have a method for customers to try and demo items before buying them while also providing guarantees and cultural support to make sure everyone feels included and seen. I think a loyalty program for creating a sticky customer base is incredibly important here and a partnership network for cleaning and returning items is a great feature for an initial launch. Something to look at that might be critical and important is client onboarding for a lot of independent brick and mortar stores that currently service this market. How will they be included in the picture and is it possible to build out a reward system or benefit method for them if they participate. This could help bring them into the fold and cut down market share being stolen from competitors and other online retailers.

- **Were the most significant user experience risks identified? What additional risk might be very important or which user experience risks were overstated?**

One significant user risk accurately identified is definitely trust and verification in the system. In a market with a ton of other competitors and individual vendors it will be difficult to start with original customer acquisition and gain momentum. Additionally, payment systems and third party issues will also be a point of concern as value scaling and network expansion will be difficult in domain. I think one risk that might be overstated is the risk of AI/AR quality. While this part of the experience is important and valued, I feel that a large portion of customers shopping within this market place have more knowledge about the garment that they're buying than a random individual trying a new clothing brand for the first time. Additionally, AI/AR tech will be in line with competitors and many of them might not have it so just the feature alone can be an advantage.
